HEALTHTRACKRX COLLECTION - SOLLIS REFERENCE

2026 urgent care collection guide / approved tubes in our workflow

APPROVED TUBES

WHITE TOP: For respiratory, genitourinary, and other ordered specialty molecular menus when the current HealthTrackRx test directory assigns the white transport tube. Specimen source must match the specific menu.

GREEN TOP: For throat / oral chlamydia-gonorrhea (CG) testing, the HealthTrackRx CGGY panel. The green tube is the designated vaginal, rectal, or oral CG collection device. Throat GC is included under the oral CG test; verify the requisition and approved swab.

These are the only HealthTrackRx collection tube types in this Sollis reference. Do not use yellow-top urine CG/CGT or gray-top culture tubes under this workflow.

ORDER AND LABEL

Use one collection tube per ordered menu. Ensure the requisition or electronic order is fully submitted.

Identify specimen with patient first and last name, date of birth, and collection site. Do not obscure the printed tube barcode or mark across the cap.

Secure the cap and specimen bag; include required paperwork and manifest according to the site’s workflow.

STORAGE AND SENDOUT

The supplied 2026 HealthTrackRx collection guide says PCR specimens are stable for up to seven days at room temperature. Confirm the actual menu and local SOP before applying this rule.

Place all sealed specimens in the approved pickup/shipping bag. Record shipment and follow the selected clinic’s current UPS or private courier schedule.
